

IN THE SPECIFICATION

On Page No. 7, at Line No. 6, please insert the following paragraphs:

“It will thus be seen that the present invention essentially discloses a two-wheeled, in-line street ski comprising a substantially planar, elongated platform, first and second truck assemblies, and first and second in-line wheels. The elongated platform has first and second platform ends, and the first and second truck assemblies are cooperatively associated therewith. In this regard, it has been shown that the first truck assembly is cooperatively associated with the first platform end, and the second truck assembly is cooperatively associated with the second platform end.

Each truck assembly comprises a wheel support pivotably associated with the elongated platform, and an elastomer spring. The wheel supports are each pivotable about a pivot axis, the pivot axes extending substantially orthogonally to the elongated platform. Each wheel support further comprises certain in-line, wheel-positioning structure. The elastomer springs are connected to the wheel supports for resisting pivoting of the respective wheel supports relative to the elongated platform. The first and second in-line wheels are rotatably mounted to the wheel supports via the in-line, wheel-positioning structure, which in-line, wheel-positioning structures function to center the first and second in-line wheels relative to the wheel supports.”
